

## Year 11 Physics Curriculum

Term 1	Topic	Details
1	<b>Units</b> <b>Energy Transfer</b>	<ul style="list-style-type: none"><li>• use the following units: kilogram (kg), joule (J), metre (m), metre/second (m/s), metre/second<sup>2</sup> (m/s<sup>2</sup>), newton (N), second (s) and watt (W)</li><li>• describe energy transfers involving energy stores: • energy stores: chemical, kinetic, gravitational, elastic, thermal, magnetic, electrostatic, nuclear • energy transfers: mechanically, electrically, by heating, by radiation (light and sound)</li><li>• use the principle of conservation of energy</li></ul>
2	<b>Work and Power</b>	<ul style="list-style-type: none"><li>• know and use the relationship between work done, force and distance moved in the direction of the force: work done = force × distance moved <math>W = F \times d</math></li><li>• know that work done is equal to energy transferred</li><li>• know and use the relationship between gravitational potential energy, mass, gravitational field strength and height: gravitational potential energy = mass × gravitational field strength × height <math>GPE = m \times g \times h</math></li><li>• know and use the relationship: kinetic energy = <math>\frac{1}{2}mv^2</math></li></ul>

		<ul style="list-style-type: none"><li>• understand how conservation of energy produces a link between gravitational potential energy, kinetic energy and work</li><li>• describe power as the rate of transfer of energy or the rate of doing work</li><li>• use the relationship between power, work done (energy transferred) and time taken: <math>\text{power} = \frac{\text{work done}}{\text{time taken}}</math></li><li>• know that specific heat capacity is the energy required to change the temperature of an object by one degree Celsius per kilogram of mass (<math>\text{J/kg } ^\circ\text{C}</math>)</li><li>• use the equation: change in thermal energy = mass <math>\times</math> specific heat capacity <math>\times</math> change in temperature <math>\Delta Q = m \times c \times \Delta T</math></li><li>• practical: investigate the specific heat capacity of materials including water and some solids</li></ul>
3	Energy	<ul style="list-style-type: none"><li>• describe how thermal energy transfer may take place by conduction, convection and radiation</li><li>• explain the role of convection in everyday phenomena</li><li>• explain how emission and absorption of radiation are related to surface and temperature</li><li>• practical: investigate thermal energy transfer by conduction, convection and radiation</li><li>• explain ways of reducing unwanted energy transfer, such as insulation</li></ul>

4	<b>Energy</b>	<ul style="list-style-type: none"><li>• know and use the relationship between efficiency, useful energy output and total energy output: <math>\text{efficiency} = \frac{\text{useful energy}}{\text{total energy}} \times 100\%</math></li><li>• describe a variety of everyday and scientific devices and situations, explaining the transfer of the input energy in terms of the above relationship, including their representation by Sankey diagrams</li></ul>
5	<b>Energy Resources and Electricity Generation</b>	<ul style="list-style-type: none"><li>• describe the energy transfers involved in generating electricity using:<ul style="list-style-type: none"><li>• wind</li><li>• water</li><li>• geothermal resources</li><li>• solar heating systems</li><li>• solar cells</li><li>• fossil fuels</li><li>• nuclear power</li></ul></li><li>• describe the advantages and disadvantages of methods of large-scale electricity production from various renewable and non-renewable resources</li></ul>
6	<b>Electricity</b>	<ul style="list-style-type: none"><li>• know the difference between mains electricity being alternating current (a.c.) and direct current (d.c.) being supplied by a cell or battery</li><li>• describe how current varies with voltage in wires, resistors, metal filament lamps and diodes, and how to investigate this experimentally</li><li>• describe the qualitative effect of</li></ul>

		<p>changing resistance on the current in a circuit</p> <ul style="list-style-type: none"><li>• describe the qualitative variation of resistance of light-dependent resistors (LDRs) with illumination and thermistors with temperature</li><li>• know that lamps and LEDs can be used to indicate the presence of a current in a circuit</li><li>• know and use the relationship between voltage, current and resistance: voltage = current <math>\times</math> resistance <math>V = I \times R</math></li><li>• know that current is the rate of flow of charge</li><li>• know and use the relationship between charge, current and time: charge = current <math>\times</math> time <math>Q = I \times t</math></li><li>• know that electric current in solid metallic conductors is a flow of negatively charged electrons</li><li>• understand why current is conserved at a junction in a circuit</li><li>• use the following units: ampere (A), coulomb (C), joule (J), ohm (<math>\Omega</math>), second (s), volt (V) and watt (W)</li></ul>
7	Energy Voltage and Circuits	<ul style="list-style-type: none"><li>• explain why a series or parallel circuit is more appropriate for particular applications, including domestic lighting</li></ul>

		<ul style="list-style-type: none"> <li>understand how the current in a series circuit depends on the applied voltage and the number and nature of other components</li> <li>know that the voltage across two components connected in parallel is the same</li> <li>calculate the currents, voltages and resistances of two resistive components connected in a series circuit</li> </ul>
8	<b>Mid Term Test and Review</b>	
9	<b>Main Electricity</b>	<ul style="list-style-type: none"> <li>understand how the use of insulation, double insulation, earthing, fuses and circuit breakers protects the device or user in a range of domestic appliances</li> <li>understand why a current in a resistor results in the electrical transfer of energy and an increase in temperature, and how this can be used in a variety of domestic contexts</li> <li>know and use the relationship between power, current and voltage: <math>\text{power} = \text{current} \times \text{voltage}</math> <math>P = I \times V</math> and apply the relationship to the selection of appropriate fuses</li> <li>use the relationship between energy transferred, current, voltage and time: <math>\text{energy transferred} = \text{current} \times \text{voltage} \times \text{time}</math> <math>E = I \times V \times t</math></li> </ul>
10	<b>Electricity Charge</b>	<ul style="list-style-type: none"> <li>identify common materials that are electrical conductors or insulators, including metals and plastics</li> <li>practical: investigate how insulating materials can be charged by friction</li> <li>explain how positive and negative electrostatic charges are produced on materials by the loss and</li> </ul>

		<p>gain of electrons</p> <ul style="list-style-type: none"> <li>• know that there are forces of attraction between unlike charges and forces of repulsion between like charges</li> <li>• explain electrostatic phenomena in terms of the movement of electrons</li> <li>• P explain the potential dangers of electrostatic charges, e.g. when fueling aircraft and tankers</li> <li>• explain some uses of electrostatic charges, e.g. in photocopiers and inkjet printers</li> </ul>
11	<p><b>Units</b></p> <p><b>Density &amp; Pressure</b></p> <p><b>Change of State</b></p>	<ul style="list-style-type: none"> <li>• use the following units: degree Celsius (<math>^{\circ}\text{C}</math>), Kelvin (K), joule (J), kilogram (kg), kilogram/metre<sup>3</sup> (<math>\text{kg/m}^3</math>), metre (m), metre<sup>2</sup> (<math>\text{m}^2</math>), metre<sup>3</sup> (<math>\text{m}^3</math>), metre/second (m/s), metre/second<sup>2</sup> (<math>\text{m/s}^2</math>), newton (N) and pascal (Pa)</li> <li>• use the following unit: joules/kilogram degree Celsius (<math>\text{J/kg } ^{\circ}\text{C}</math>)</li> <li>• know and use the relationship between density, mass and volume: density/mass/volume</li> <li>• practical: investigate density using direct measurements of mass and volume</li> <li>• know and use the relationship between pressure, force and area: pressure=force/area</li> <li>• understand how the pressure at a point in a gas or liquid at rest acts equally in all directions</li> <li>• know and use the relationship for pressure difference: pressure difference = height <math>\times</math> density <math>\times</math> gravitational field strength <math>p = h \times \rho \times g</math></li> <li>• explain why heating a system</li> </ul>

		<p>will change the energy stored within the system and raise its temperature or produce changes of state</p> <ul style="list-style-type: none"><li>• describe the changes that occur when a solid melts to form a liquid, and when a liquid evaporates or boils to form a gas</li><li>• describe the arrangement and motion of particles in solids, liquids and gases</li><li>• practical: obtain a temperature–time graph to show the constant temperature during a change of state</li></ul>
12	<b>Ideal Gas Molecules</b>	<ul style="list-style-type: none"><li>• explain how molecules in a gas have random motion and that they exert a force, and hence a pressure, on the walls of a container</li><li>• understand why there is an absolute zero of temperature, which is <math>-273\text{ }^{\circ}\text{C}</math></li><li>• describe the Kelvin scale of temperature and be able to convert between the Kelvin and Celsius scales</li><li>• understand why an increase in temperature results in an increase in the average speed of gas molecules</li><li>• know that the Kelvin temperature of a gas is proportional to the average kinetic energy of its molecules</li><li>• explain, for a fixed amount of gas, the qualitative relationship between:<ul style="list-style-type: none"><li>• pressure and volume at constant temperature</li><li>• pressure and Kelvin temperature at constant volume</li></ul></li><li>• use the relationship between the pressure and Kelvin temperature of a fixed mass of gas at constant</li></ul>

		<p>volume: <math>P_1/T_1 = P_2/T_2</math></p> <ul style="list-style-type: none"><li>• use the relationship between the pressure and volume of a fixed mass of gas at constant temperature: <math>p_1 V_1 = p_2 V_2</math></li></ul>
<b>13</b>	<b>Units</b>  <b>Radioactivity</b>	<ul style="list-style-type: none"><li>• use the following units: becquerel (Bq), centimetre (cm), hour (h), minute (min) and second (s)</li><li>• describe the structure of an atom in terms of protons, neutrons and electrons and use symbols such as <math>{}^{14}_6\text{C}</math> to describe particular nuclei</li><li>• know the terms atomic (proton) number, mass (nucleon) number and isotope</li><li>• know that alpha (<math>\alpha</math>) particles, beta (<math>\beta^-</math>) particles, and gamma (<math>\gamma</math>) rays are ionising radiations emitted from unstable nuclei in a random process</li><li>• describe the nature of alpha (<math>\alpha</math>) particles, beta (<math>\beta^-</math>) particles and gamma (<math>\gamma</math>) rays, and recall that they may be distinguished in terms of penetrating power and ability to ionise</li><li>• practical: investigate the penetration powers of different types of radiation using either radioactive sources or simulations</li><li>• describe the effects on the atomic and mass numbers of a nucleus of the emission of each of the four main types of radiation (alpha, beta, gamma and neutron radiation)</li></ul>
<b>14</b>	<b>Nuclear</b>	<ul style="list-style-type: none"><li>• understand how to balance nuclear equations in terms of mass and charge</li><li>• know that photographic film or a Geiger–Müller detector can detect ionising radiations</li><li>• know that the activity of a radioactive source decreases</li></ul>

		<p>over a period of time and is measured in becquerels</p> <ul style="list-style-type: none"><li>• know the definition of the term 'half-life' and understand that it is different for different radioactive isotopes</li><li>• use the concept of the half-life to carry out simple calculations on activity, including graphical methods</li></ul>
15	<b>Fission and Fusion</b>	<ul style="list-style-type: none"><li>• explain the sources of background (ionising) radiation from Earth and space</li><li>• describe uses of radioactivity in industry and medicine</li><li>• describe the difference between contamination and irradiation</li><li>• describe the dangers of ionising radiations, including: • that radiation can cause mutations in living organisms • that radiation can damage cells and tissue • the problems arising from the disposal of radioactive waste and how the associated risks can be reduced</li><li>• know that nuclear reactions, including fission, fusion and radioactive decay, can be a source of energy</li><li>• understand how a nucleus of U-235 can be split (the process of fission) by collision with a neutron and that this process releases energy as kinetic energy of the fission products</li><li>• know that the fission of U-235 produces two radioactive daughter nuclei and a small number of neutrons</li><li>• describe how a chain reaction can be set up if the neutrons produced by one fission strike other U-235 nuclei</li><li>• describe the role played by the control rods and moderator in</li></ul>

		<p>the fission process</p> <ul style="list-style-type: none"><li>• understand the role of shielding around a nuclear reactor</li><li>• explain the difference between nuclear fusion and nuclear fission</li><li>• describe nuclear fusion as the creation of larger nuclei resulting in a loss of mass from smaller nuclei, accompanied by a release of energy</li><li>• know that fusion is the energy source for stars</li><li>• explain why nuclear fusion does not happen at low temperatures and pressures, due to electrostatic repulsion of protons</li></ul>
16	End of Term Test and Review	

Term 2	Topic	Details
1	<b>Forces, Movement, Shape and Momentum</b>	<ul style="list-style-type: none"><li>• describe the effects of forces between bodies such as changes in speed, shape or direction</li><li>• identify different types of force such as gravitational or electrostatic</li><li>• understand how vector quantities differ from scalar quantities</li><li>• understand that force is a vector quantity</li><li>• calculate the resultant force of forces that act along a line</li><li>• know and use the relationship between weight, mass and gravitational field strength: <math>\text{weight} = \text{mass} \times \text{gravitational field strength}</math></li></ul>
2	<b>Forces, Movement, Shape and Momentum</b>	<ul style="list-style-type: none"><li>• practical: investigate how extension varies with applied force for helical springs, metal wires and rubber bands</li><li>• know that the initial linear region of a force-extension graph is associated with Hooke's law</li><li>• describe elastic behaviour as the ability of a material to recover its original shape after the forces causing deformation have been removed</li><li>• know and use the relationship between the moment of a force and its perpendicular distance from the pivot: <math>\text{moment} = \text{force} \times \text{perpendicular distance from the pivot}</math></li><li>• know that the weight of a body acts through its centre of gravity</li><li>• use the principle of moments for a simple system of parallel forces acting in one plane</li><li>• understand how the upward forces on a light beam, supported at its ends, vary with the position of a heavy</li></ul>

		object placed on the beam
3	<b>Movement and Position</b>	<ul style="list-style-type: none"><li>• plot and explain distance–time graphs</li><li>• know and use the relationship between average speed, distance moved and time taken</li><li>• practical: investigate the motion of everyday objects such as toy cars or tennis balls</li><li>• know and use the relationship between acceleration, change in velocity and time taken:</li><li>• plot and explain velocity–time graphs</li><li>• determine acceleration from the gradient of a velocity–time graph</li><li>• determine the distance travelled from the area between a velocity–time graph and the time axis</li><li>• use the relationship between final speed, initial speed, acceleration and distance moved:</li><li>• describe the forces acting on falling objects (and explain why falling objects reach a terminal velocity)</li></ul>
4	<b>Movement and Position</b>	<ul style="list-style-type: none"><li>• know that friction is a force that opposes motion</li><li>• know and use the relationship between unbalanced force, mass and acceleration: <math>\text{force} = \text{mass} \times \text{acceleration}</math></li><li>• know that the stopping distance of a vehicle is made up of the sum of the thinking distance and the braking distance</li><li>• describe the factors affecting vehicle stopping distance, including speed, mass, road condition and reaction time</li><li>• know and use the relationship between momentum, mass and velocity: <math>\text{momentum} =</math></li></ul>

		<p>mass <math>\times</math> velocity</p> <ul style="list-style-type: none"> <li>• use the idea of momentum to explain safety features</li> <li>• use the conservation of momentum to calculate the mass, velocity or momentum of objects</li> <li>• use the relationship between force, change in momentum and time taken: <math>\text{force} = \frac{\text{change in momentum}}{\text{time taken}}</math></li> <li>• demonstrate an understanding of Newton's third law</li> </ul>
5	<b>Properties of Waves</b>	<ul style="list-style-type: none"> <li>• explain the difference between longitudinal and transverse waves</li> <li>• know the definitions of amplitude, wavefront, frequency, wavelength and period of a wave</li> <li>• know that waves transfer energy and information without transferring matter</li> <li>• know and use the relationship between the speed, frequency and wavelength of a wave: <math>\text{wave speed} = \text{frequency} \times \text{wavelength}</math> <math>v = f \times \lambda</math></li> <li>• use the relationship between frequency and time period: <math>\text{frequency} = \frac{1}{\text{time period}}</math></li> <li>• explain that all waves can be reflected and refracted</li> </ul>
6	<b>The electro-magnetic spectrum</b>	<ul style="list-style-type: none"> <li>• know that light is part of a continuous electromagnetic spectrum that includes radio, microwave, infrared, visible, ultraviolet, x-ray and gamma ray radiations, and that all these waves travel at the same speed in free space</li> <li>• know the order of the electromagnetic spectrum in terms of decreasing wavelength and increasing frequency, including the colours of the visible spectrum</li> <li>• explain some of the uses of electromagnetic radiations, including: <ul style="list-style-type: none"> <li>• radio waves: broadcasting and communications</li> </ul> </li> </ul>

		<p>microwaves: cooking and satellite transmissions • infrared: heaters and night vision equipment • visible light: optical fibres and photography • ultraviolet: fluorescent lamps • x-rays: observing the internal structure of objects and materials, including for medical applications • gamma rays: sterilising food and medical equipment</p> <ul style="list-style-type: none"> <li>• explain the detrimental effects of excessive exposure of the human body to electromagnetic waves, including: <ul style="list-style-type: none"> <li>• microwaves: internal heating of body tissue</li> <li>• infrared: skin burns • ultraviolet: damage to surface cells and blindness • gamma rays: cancer, mutation and describe simple protective measures against the risks</li> </ul> </li> </ul>
7	Light & Sound	<ul style="list-style-type: none"> <li>• "use the following units: degree (°), hertz (Hz), metre (m), metre/second (m/s) and second (s)"</li> <li>• know that light waves are transverse waves and that they can be reflected and refracted</li> <li>• use the law of reflection (the angle of incidence equals the angle of reflection)</li> <li>• draw ray diagrams to illustrate reflection and refraction</li> <li>• practical: investigate the refraction of light, using rectangular blocks, semi-circular blocks and triangular prisms</li> <li>• know and use the relationship between refractive index, angle of incidence and angle of refraction: <math>n = \frac{\sin i}{\sin r}</math></li> <li>• practical: investigate the refractive index of glass, using a glass block</li> <li>• describe the role of total</li> </ul>

		<p>internal reflection in transmitting information along optical fibres and in prisms</p> <ul style="list-style-type: none"> <li>• explain the meaning of critical angle <math>c</math></li> <li>• know and use the relationship between critical angle and refractive index: <math>\sin c = 1/n</math></li> </ul>
<b>8</b>	<b>Review and Test</b>	
<b>9</b>	<b>Sound</b>	<ul style="list-style-type: none"> <li>• use the above relationships in different contexts, including sound waves and electromagnetic waves</li> <li>• explain why there is a change in the observed frequency and wavelength of a wave when its source is moving relative to an observer and that this is known as the Doppler effect</li> <li>• know that sound waves are longitudinal waves that can be reflected and refracted</li> <li>• know that the frequency range for human hearing is 20–20 000 Hz</li> <li>• practical: investigate the speed of sound in air</li> <li>• understand how an oscilloscope and microphone can be used to display a sound wave</li> <li>• practical: investigate the frequency of a sound wave using an oscilloscope</li> <li>• understand how the pitch of a sound relates to the frequency of vibration of the source</li> <li>• understand how the loudness of a sound relates to the amplitude of vibration of the source</li> </ul>
<b>10</b>	<b>Magnetism and Electromagnets</b>	<ul style="list-style-type: none"> <li>• know that magnets repel and attract other magnets and attract magnetic substances</li> <li>• describe the properties of magnetically hard and soft materials</li> </ul>

		<ul style="list-style-type: none"> <li>• understand the term 'magnetic field line'</li> <li>• know that magnetism is induced in some materials when they are placed in a magnetic field</li> <li>• practical: investigate the magnetic field pattern for a permanent bar magnet and between two bar magnets</li> <li>• describe how to use two permanent magnets to produce a uniform magnetic field pattern</li> <li>• know that an electric current in a conductor produces a magnetic field around it</li> <li>• describe the construction of electromagnets</li> <li>• draw magnetic field patterns for a straight wire, a flat circular coil and a solenoid when each is carrying a current</li> <li>• know that there is a force on a charged particle when it moves in a magnetic field as long as its motion is not parallel to the field</li> </ul>
11	Electromagnet Induction	<ul style="list-style-type: none"> <li>• use the following units: ampere (A), volt (V) and watt (W)</li> <li>• understand why a force is exerted on a current-carrying wire in a magnetic field and how this effect is applied in simple d.c. electric motors and loudspeakers</li> <li>• use the left-hand rule to predict the direction of the resulting force when a wire carries a current perpendicular to a magnetic field</li> <li>• describe how the force on a current-carrying conductor in a magnetic field changes with the magnitude and direction of the field and</li> </ul>

		<p>current</p> <ul style="list-style-type: none"> <li>• know that a voltage is induced in a conductor or a coil when it moves through a magnetic field or when a magnetic field changes through it and describe the factors that affect the size of the induced voltage</li> <li>• describe the generation of electricity by the rotation of a magnet within a coil of wire and of a coil of wire within a magnetic field, and describe the factors that affect the size of the induced voltage</li> <li>• describe the structure of a transformer and understand that a transformer changes the size of an alternating voltage by having different numbers of turns on the input and output sides</li> <li>• explain the use of step-up and step-down transformers in the large-scale generation and transmission of electrical energy</li> <li>• know and use the relationship between input (primary) and output (secondary) voltages and the turns ratio for a transformer:</li> <li>• know and use the relationship: input power = output power <math>p_s V I = V I</math> for 100% efficiency</li> </ul>
12	<p><b>Motion in the Universe</b></p> <p><b>Stellar Evolution</b></p>	<ul style="list-style-type: none"> <li>• use the following units: kilogram (kg), metre (m), metre/second (m/s), metre/second<sup>2</sup> (m/s<sup>2</sup>), newton (N), second (s), newton/kilogram (N/kg)</li> <li>• know that: <ul style="list-style-type: none"> <li>• the universe is a large collection of billions of galaxies</li> <li>• a galaxy is a large collection of billions of stars</li> <li>• our solar system is in the Milky Way galaxy</li> </ul> </li> </ul>

		<ul style="list-style-type: none"><li>• understand why gravitational field strength, <math>g</math>, varies and know that it is different on other planets and the Moon from that on the Earth</li><li>• explain that gravitational force: • causes moons to orbit planets • causes the planets to orbit the Sun • causes artificial satellites to orbit the Earth • causes comets to orbit the Sun</li><li>• describe the differences in the orbits of comets, moons and planets</li><li>• use the relationship between orbital speed, orbital radius and time period:</li><li>• understand how stars can be classified according to their colour</li><li>• know that a star's colour is related to its surface temperature</li><li>• describe the evolution of stars of similar mass to the Sun through the following stages: • nebula • star (main sequence) • red giant • white dwarf</li><li>• describe the evolution of stars with a mass larger than the Sun</li><li>• understand how the brightness of a star at a standard distance can be represented using absolute magnitude</li><li>• draw the main components of the Hertzsprung–Russell diagram (HR diagram)</li></ul>
13	Cosmology	<ul style="list-style-type: none"><li>• describe the past evolution of the universe and the main arguments in favour of the Big Bang theory</li><li>• describe evidence that supports the Big Bang theory (red-shift and cosmic</li></ul>

		<p>microwave background – CMB – radiation)</p> <ul style="list-style-type: none"><li>• describe that if a wave source is moving relative to an observer, there will be a change in the observed frequency and wavelength</li><li>• use the equation relating to change in wavelength, reference wavelength, velocity of a galaxy and the speed of light:</li><li>• describe the red-shift in light received from galaxies at different distances away from the Earth</li><li>• explain why the red-shift of galaxies provides evidence for the expansion of the universe</li></ul>
<b>14</b>	<b>Course Review – Term 1 and past exam papers</b>	
<b>15</b>	<b>Course Review – Term 2 and past exam papers</b>	
<b>16</b>	<b>End of Term Test and Review</b>
